Synthetic Substitution

LD!

$$(3x^3 + 4x^2 + 10) \div (x-2)$$
$$\begin{array}{r} 3x^2 + 10x + 20 \\ x-2 \overline{) 3x^3 + 4x^2 + 0x + 10} \\ \underline{-(3x^3 - 6x^2)} \\ 10x^2 + 0x \\ \underline{-(10x^2 - 20x)} \\ 20x + 10 \\ \underline{-(20x - 40)} \\ 50 \end{array}$$

$3x^2 + 10x + 20 + \frac{50}{x-2}$

$$(3x^3 + 4x^2 + 10) \div (x-2)$$

Because the divisor is
linear (exponent 1)

We can use Synthetic

A. use all coefficients (include 0's)
of dividend

3 4 0 10

B. weird. division sign-

$$\left\{ \begin{array}{cccc} 3 & 4 & 0 & 10 \end{array} \right.$$

C. change sign of a in (x-a) divisor.

$$x-2 \Rightarrow +2$$

2	3	4	0	10
	3	6	20	40
	3	10	20	50
	x^2	x	C	R

$\left. \begin{array}{l} 4 \text{ } \left. \begin{array}{l} \text{ } \\ \text{ } \end{array} \right\} \text{add} \\ 6 \end{array} \right\}$
 $\left. \begin{array}{l} 0 \\ 20 \end{array} \right\}$
 $\left. \begin{array}{l} 10 \\ 40 \end{array} \right\}$

$$3x^2 + 10x + 20 \ R \ 50$$

Remainder
Thm.

$$P(2) = 50$$

Evaluate $3x^3 + 4x^2 + 10$ @ 2

$$3(8) + 4(2)^2 + 10$$

$$24 + 16 + 10$$

$$40 + 10$$

$$\underline{50}$$

$$(x^2 + 5x - 28) \div (x + 3)$$

3	1	5	-28
↓	3	24	
	1	8	-4
	x	c	R

$x + 8 \quad R - 4$

• $\left\{ \begin{array}{l} \text{Since } R = -4, \text{ We know} \\ P(3) = -4 \end{array} \right.$

} Remainder

$$P(3) = -4$$

- aka: Evaluate $x^2 + 5x - 28$ at $x = 3$.

$$\underline{\underline{9 + 15 - 28 = -4}}$$

Remainder
Thm.

$R = 0$ means the divisor
is a factor.

$R \neq 0$ means the divisor
is not a factor

- A • $(4x^2 - 12x - 9) \div (x + \frac{1}{2})$
- B • Evaluate P @ $x = -\frac{1}{2}$
- C • Is $(x + \frac{1}{2})$ a factor of $4x^2 - 12x - 9$?

change sign.

$-\frac{1}{2}$	·	4	-12	-9
		↓	-2	7
		4	-14	-2
		x	c	R

A.

$4x - 14 \quad R = -2$

B

$D(-\frac{1}{2}) = \dots$

$$B. \quad \boxed{P(-1/2) = -2}$$

↑
no change

C. No because $R \neq 0$.

Factoring:

1. $x^2 - y^2 \Rightarrow (x+y)(x-y)$

2. Quadratic type

$$x^4 - y^8$$

$$(x^2)^2 - (y^4)^2 \Rightarrow (x^2 + y^4)(x^2 - y^4)$$

$$\boxed{(x^2 + y^4)(x + y^2)(x - y^2)}$$

3.) $3x^4 - 26x^2 - 9$

quadratic
Type.

$$a = x^2$$

$$\boxed{3a^2 - 26a - 9}$$

grouping

$$\left\{ \begin{array}{l} \underline{3a^2 + 1a} - \underline{27a - 9} \\ a(3a+1) - 9(3a+1) \\ (3a+1)(a-9) \end{array} \right. \Rightarrow (3x^2+1)(x^2-9)$$

$$\boxed{(3x^2+1)(x+3)(x-3)}$$

$$a^3 + b^3 \Rightarrow (a+b)(a^2 - ab + b^2)$$

$$x^3 - y^3 \Rightarrow (x-y)(x^2 + xy + y^2)$$
